

COMMUTER SURVEY RESULTS

Project engineers and planners are studying such aspects as traffic characteristics, roadway deficiencies, and environmental features. Concurrently, the DRPA had asked commuters to provide input through an online survey. Commuters indicated such information as where they drive from, where they drive to and how much time they wait in morning congestion.

This information will help the DRPA and project staff understand how different types of drivers would use such resources as increased real-time traffic information. We are striving to understand as much about our region's commuters as possible to make informed and effective decisions.
